Abstracts

Physical Vapor Deposition - also known as PVD Coating - refers to a variety of thin film deposition techniques where solid metal is vaporized in a high vacuum environment and deposited on electrically conductive materials as a pure metal or alloy coating. As a process that transfers the coating material on a single atom or molecule level, it can provide extremely pure and high performance coatings which for many applications are much preferable to electroplating. PVD Coating processes are an environmentally friendly process that can greatly reduce the amount of toxic substances that must be disposed of with more conventional types of coating that involve fluid precursors and chemical reactions.

This report elaborates the market size, market characteristics, and market growth of the PVD Coating Services industry, and breaks down according to the type, application, and consumption area of PVD Coating Services. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for PVD Coating Services in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
