Abstracts

Railway Grease is a semisolid lubricant used in in the rail transport sector, which can reduce the friction at the rail-wheel interface, extend rail and wheel life, reduce fuel consumption and reduce wheel squeeze. Grease generally consists of a soap emulsified with mineral or vegetable oil. The characteristic feature of greases is that they possess a high initial viscosity, which upon the application of shear, drops to give the effect of an oil-lubricated bearing of approximately the same viscosity as the base oil used in the grease.

This report elaborates the market size, market characteristics, and market growth of the Railway Grease industry, and breaks down according to the type, application, and consumption area of Railway Grease. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Railway Grease in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
