Abstracts

Refractory bricks, also known as fire bricks, are bricks made of heat-resistant ceramic materials that are similar in shape to ordinary building bricks and are therefore commonly used in construction furnaces and various thermal equipment. On the one hand, refractory bricks do not have chemical changes at high temperatures, and are generally materials with poor heat conduction. Usually dense refractory bricks are used under conditions of extreme mechanical stress, chemical stress and thermal stress, such as wood-fired kiln or furnace, which are easily worn by wood, contaminated with ash or slag, and high temperature conditions.

This report elaborates the market size, market characteristics, and market growth of the Refractory Bricks industry, and breaks down according to the type, application, and consumption area of Refractory Bricks. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Refractory Bricks in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
