Abstracts

A rocket is used to explore space as well as for defense purposes. They are used to transport human and other devices in the space where they are fueled in such a way that they have fast speeds required to travel outside the gravity. Missiles, on the other hand, is a term which is strictly used for just military purposes. They have high speeds are able to navigate through the gravity and friction to reach their target. They both have very high velocities, the ranges are greater but the tasks are different. A rocket needs initial guidance when it is left in the atmosphere and after that follows a straight path which has been programmed while a missile needs constant guidance and is programmed in such a way that it can change its path or quickly follow a new path, this technology is used brilliantly in the ballistic missiles.

This report elaborates the market size, market characteristics, and market growth of the Rocket and Missile industry, and breaks down according to the type, application, and consumption area of Rocket and Missile. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Rocket and Missile in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
