## Abstracts

Sand and gravel deposits found on beaches or in rivers and streams, are mostly quartz (silicon dioxide, SiO<sub>2</sub>) grains. Weathering of rocks such as granite forms these quartz grains. In the process of weathering, the softer, weaker minerals in granite (such as feldspar) are weathered away.

The more resistant quartz eventually is ground down in size, but does not break down chemically. In time, these quartz grains accumulate in rivers, streams, deltas and on beaches.

This report elaborates the market size, market characteristics, and market growth of the Sand and Gravel industry, and breaks down according to the type, application, and consumption area of Sand and Gravel. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Sand and Gravel in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
