## Abstracts

Satellite payloads are a type of operating or core functional elements of the assembly of satellite. Satellite chiefly consists of the payloads and the bus. Satellite bus acts as the a carrier to transfer the subsystems and payloads that are required by the payload to operate its mission or function while in orbit. The payload is a type of assembly consisting of several elemental blocks, for instance the antennas and the repeater, which are required for a satellite to complete the goal of its deployment. The chief and most important operation of the satellite payload is to raise and enhance the maximum utility capacity of carrying of a satellite and operate on functions associated with navigation, communication, imaging and others.

This report elaborates the market size, market characteristics, and market growth of the Satellite Payloads industry, and breaks down according to the type, application, and consumption area of Satellite Payloads. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Satellite Payloads in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
