## **Abstracts**

Seismic Isolation Systems is the system used to reduce the effects of the earthquake ground shaking on structure, their components and protect them from damage. The system decouples the building or structure from the horizontal components of the ground motion by interposing structural elements with low horizontal stiffness between the structure and the foundation. This gives the structure a fundamental frequency that is much lower than both its fixed-base frequency and the predominant frequencies of the ground motion.

This report elaborates the market size, market characteristics, and market growth of the Seismic Isolation Systems industry, and breaks down according to the type, application, and consumption area of Seismic Isolation Systems. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Seismic Isolation Systems in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
