Abstracts

Self-Cleaning Glass is a low maintenance glass made by depositing a thin layer of chemical that has photolytic and hydrophilic properties, which makes the glass easier to clean. Self-cleaning glass is fog and glare resistant. The material applied doesn't alter the usual properties of glass, such as mechanical, thermal and acoustic properties. Self-cleaning glass is a quintessential part of hard to reach areas for manual cleaning, such as facades and exterior shop fronts. It has a layer of titanium oxide over the surface that undergoes a chemical reaction on the surface, thus breaking dirt and other materials into smaller pieces that can be easily washed off by rain or on the application of water. The layer is also hydrophilic in nature, unlike normal glass, which is hydrophobic. As a result, on the application of water on the surface, water spreads evenly across the glass and wipes off the dirt.

This report elaborates the market size, market characteristics, and market growth of the Self-Cleaning Glass industry, and breaks down according to the type, application, and consumption area of Self-Cleaning Glass. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Self-Cleaning Glass in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
