## Abstracts

The shaft locking device uses a keyless mechanical interference fit to securely connect the hub to the shaft to transmit torque or withstand axial thrust. This mechanical interference fit takes advantage of the screw tension in the shaft lock and converts it into radial pressure through an inclined plane. This pressure expands the shaft locking device, thereby eliminating the gap between the hub and the shaft. The shaft lock uses a frictional combination between the shaft lock and the shaft / hub to establish a zero-gap connection. The connection can be easily released to eliminate mechanical interference fits.

This report elaborates the market size, market characteristics, and market growth of the Shaft Locking Devices industry, and breaks down according to the type, application, and consumption area of Shaft Locking Devices. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Shaft Locking Devices in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
