## **Abstracts**

Silicified Microcrystalline Cellulose is composed of intimately associated microcrystalline cellulose and colloidal silicon dioxide particles, derived from aqueous coprocessing prior to drying the material during manufacture. The microcrystalline cellulose component is purified, partially depolymerized cellulose, prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids. The colloidal silicon dioxide is a submicroscopic fumed silica prepared by the vapor-phase hydrolysis of a silicon compound. The Residue on ignition result indicates the percentage of colloidal silicon dioxide; the remainder is microcrystalline cellulose.

This report elaborates the market size, market characteristics, and market growth of the Silicified Microcrystalline Cellulose in Pharmaceutical industry, and breaks down according to the type, application, and consumption area of Silicified Microcrystalline Cellulose in Pharmaceutical. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Silicified Microcrystalline Cellulose in Pharmaceutical in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
