Abstracts

Sodium carbonate, Na_2CO_3 , (also known as washing soda, soda ash and soda crystals, and in the monohydrate form as crystal carbonate) is the water-soluble sodium salt of carbonic acid.

It most commonly occurs as a crystalline decahydrate, which readily effloresces to form a white powder, the monohydrate. Pure sodium carbonate is a white, odorless powder that is hygroscopic (absorbs moisture from the air). It has a strongly alkaline taste, and forms a moderately basic solution in water. Sodium carbonate is well known domestically for its everyday use as a water softener. Historically it was extracted from the ashes of plants growing in sodium-rich soils, such as vegetation from the Middle East, kelp from Scotland and seaweed from Spain. Because the ashes of these sodium-rich plants were noticeably different from ashes of timber (used to create potash), they became known as 'soda ash'. It is synthetically produced in large quantities from salt (sodium chloride) and limestone by a method known as the Solvay process.

This report elaborates the market size, market characteristics, and market growth of the Soda Crystals industry, and breaks down according to the type, application, and consumption area of Soda Crystals. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Soda Crystals in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
