## Abstracts

Sputtering is a process whereby particles are ejected from a solid target material due to bombardment of the target by energetic particles, particularly gas ions in a laboratory. It only happens when the kinetic energy of the incoming particles is much higher than conventional thermal energies ( $> 1$  eV). This process can lead, during prolonged ion or plasma bombardment of a material, to significant erosion of materials, and can thus be harmful. On the other hand, it is commonly used for thin-film deposition, etching and analytical techniques. Sputtering is done either using DC voltage (DC sputtering) or using AC voltage (RF sputtering). In DC sputtering, voltage is set from 3-5 kV and in RF sputtering, power supply is set at 14 MHz. Due to the application of an alternating current, the ions inside the plasma oscillate resulting in an increase in the levels of plasma.

This report elaborates the market size, market characteristics, and market growth of the Sputtering Target Material industry, and breaks down according to the type, application, and consumption area of Sputtering Target Material. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Sputtering Target Material in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
