Abstracts

The photomask consists of a fused silica (QZ) or glass (SL) substrate coated with an opaque film in which an exact copy of the device designer pattern is etched. The photomask has a function similar to that used in photography. Just like printing the same picture from film, the photomask can reproduce thousands of circuits and patterns. Photolithography techniques are used in photomask fabrication processes to create chrome patterns on quartz substrates. The completed photomask is then used as a photographic plate for an LSI, LCD, PCB, or the like.

This report elaborates the market size, market characteristics, and market growth of the Tft-LCD Photomask industry, and breaks down according to the type, application, and consumption area of Tft-LCD Photomask. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Tft-LCD Photomask in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
