Abstracts

Thorium are naturally occurring radioactive materials that are present in small amounts in rocks and soil. Helium can be introduced as a nuclear fuel into seven types of reactors. Helium-fueled reactors are safer because the reaction is easy to stop because the operation does not have to be carried out under extreme pressure. Compared to uranium reactors, helium reactors produce much less waste, produce much less radioactivity and have a much shorter life.
This report elaborates the market size, market characteristics, and market growth of the Thorium Reactor industry, and breaks down according to the type, application, and consumption area of Thorium Reactor. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Thorium Reactor in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
