Abstracts

Tissue-engineered skin substitutes have become viable as a suitable alternative to auto- and allografts. Chronic wounds and extensive skin loss have become serious problem globally. Even if injured epidermis is normally able to self-renew, deep injuries can cause negative regulation of the wound healing cascade, leading to chronic wound formation. Skin-autografting surgical procedures are often limited by the poor availability of healthy tissue, whereas the use of non-self-tissues for allografts presents some severe risks.

This report elaborates the market size, market characteristics, and market growth of the Tissue Engineered Skin Substitutes industry, and breaks down according to the type, application, and consumption area of Tissue Engineered Skin Substitutes. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Tissue Engineered Skin Substitutes in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
