Abstracts

When applied to data security, tokenization is the process of replacing sensitive data elements with non-sensitive equivalents, which have no external or exploitable meaning or value. A token is a reference (ie, an identifier) that maps back sensitive data through a tokenization system. The mapping from raw data to tokens uses a method of making tokens unavailable without a tokenizing system, such as using tokens created from random numbers.

This report elaborates the market size, market characteristics, and market growth of the Tokenization industry, and breaks down according to the type, application, and consumption area of Tokenization. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Tokenization in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
