Abstracts

A traction transformer is a large single-phase transformer fitted in the locomotive to feed power to traction motors and other auxiliaries. It takes 25kv AC from the overhead line as primary voltage. This voltage is then stepped down to say 1500volts and fed to a rectifier for running DC traction motors. Alternatively, the output of traction transformer may be fed to rectifier - inverter set for running three-phase AC traction motors.

This report elaborates the market size, market characteristics, and market growth of the Traction Transformer industry, and breaks down according to the type, application, and consumption area of Traction Transformer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Traction Transformer in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
