Abstracts

Transmission electron microscopy (TEM) is a microscopic technique in which an electron beam is transmitted through a sample to form an image. The sample is typically an ultra-thin portion or suspension on a grid that is less than 100 nanometers thick. When the beam passes through the sample, an image is formed by the interaction of the electron with the sample. The image is then magnified and focused to the imaging device.

This report elaborates the market size, market characteristics, and market growth of the Transmission Electron Microscope (TEM) industry, and breaks down according to the type, application, and consumption area of Transmission Electron Microscope (TEM). The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Transmission Electron Microscope (TEM) in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
