Abstracts

Triple-negative breast cancer is a type of cancer that does not have receptors for the hormones oestrogen and progesterone or the protein HER2. Triple-negative breast cancer is a rare type of cancer. About 10–20% of breast cancers are found to be triple negative. Triple-negative breast cancer does not respond to hormonal therapy or therapies that target HER2 receptors such as Herceptin (trastuzumab). The treatment combines surgery, radiotherapy and chemotherapy. Triple-negative breast cancer is more likely to spread beyond the breast and has chances of reoccurrence after 3 years. New chemotherapy drugs and combination drugs are under development for the treatment of triple-negative breast cancer.
