## Abstracts

A turntable is the circular rotating platform of a phonograph (a.k.a. record player, gramophone, turntable, etc.), a device for playing sound recordings. It is one of the longest lasting technologies which are still manufactured. The base of a turntable can be made of nearly any material and come in a variety of shapes. The important task is making the whole system run as it holds the motor either a direct drive or through a belt or wheel system which moves the platter, or the spinning surface that the record is placed on. Bases are also the place where manufacturers exhibit the most creative touches, whether it is natural wood or a black lacquered rig. The latter is the next important piece. It is responsible for maintaining a consistent and uninterrupted speed which will play the record. Heavy materials are highly valued in the construction of the platter and the most expensive turntables on the market will often be made of ultra-weighted aluminum. A heavy platter is a key to a rumble-free and steady sound too light, and the record has the potential to rattle around from the speed of the motor. On top of the platter, there is a rubber mat which helps the record stay in place without risking scratches.

This report elaborates the market size, market characteristics, and market growth of the Turntables industry, and breaks down according to the type, application, and consumption area of Turntables. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Turntables in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
