Abstracts

A recent technology developed by a team at MIT combines acoustic signals and RADAR to enable submerged submarines to communicate with airplanes. An underwater transmitter uses an acoustic speaker pointed upward to the surface. The transmitter sends sound signals, which travel as pressure waves. When these waves hit the surface, they cause tiny vibrations. Above the water, a radar continuously bounces a radio signal off the water surface. When the surface vibrates slightly thanks to the sound signal, the radar can detect the vibrations, completing the signal's journey from the underwater speaker to an in-air receiver. The technology is called TARF (Translational Acoustic-RF) communication since it uses a translation between acoustic and RF signals. While promising, this technology is still in its infancy and has only been tested in relatively controlled environments with small surface ripples.

This report elaborates the market size, market characteristics, and market growth of the Underwater Radio Communication industry, and breaks down according to the type, application, and consumption area of Underwater Radio Communication. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Underwater Radio Communication in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
