Abstracts

Typical UV curable resins consist of oligomers, monomers (which act as diluents), photopolymerization initiator, coinitiators (spectral sensitizer, reducing agents etc.) and various additives such as stabilizers, antioxidants, plasticizers, and pigments. The majority of commercial light cure resins are based on free radical curing acrylic compounds (acrylates). Free radical curing compositions are the most versatile curing systems in regard to product properties and monomers / oligomers available on the market. However, free radical acrylic systems are subject to oxygen inhibition, meaning oxygen in the air can stop the molecules at the surface from polymerizing, leaving a tacky surface layer.

This report elaborates the market size, market characteristics, and market growth of the UV Curable Resins industry, and breaks down according to the type, application, and consumption area of UV Curable Resins. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for UV Curable Resins in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
