Abstracts

Vigabatrin is a GABA derivative that is used in combination with other agents as therapy of refractory complex partial seizures and as monotherapy for infantile spasms.

Vigabatrin is associated with a paradoxical decrease in serum enzyme levels during therapy, explained by its direct inhibition of aminotransferase activity. Vigabatrin has not been convincingly linked to cases of clinically apparent liver injury, but was linked to a fatal case of Reye syndrome in a child with severe developmental delay.

This report elaborates the market size, market characteristics, and market growth of the Vigabatrin industry, and breaks down according to the type, application, and consumption area of Vigabatrin. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Vigabatrin in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
