Abstracts

A virtual private server (VPS) is a virtual machine sold as a service by an Internet hosting service.

A VPS runs its own copy of an operating system (OS), and customers may have superuser-level access to that operating system instance, so they can install almost any software that runs on that OS. For many purposes they are functionally equivalent to a dedicated physical server, and being software-defined, are able to be much more easily created and configured.

This report elaborates the market size, market characteristics, and market growth of the Virtual Private Server industry, and breaks down according to the type, application, and consumption area of Virtual Private Server. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Virtual Private Server in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
