## Abstracts

Wear Resistant Steel Plate is a high-carbon alloy steel plate. This means that AR is harder due to the addition of carbon, and formable and weather resistant due to added alloys.

Carbon added during the formation of the steel plate substantially increases toughness and hardness, but reduces strength. Therefore, AR plate is used in situations where abrasions and wear and tear are the main causes of failure. AR plate is not ideal for structural construction uses like support beams in bridges or buildings.

This report elaborates the market size, market characteristics, and market growth of the Wear Resistant Steel Plate industry, and breaks down according to the type, application, and consumption area of Wear Resistant Steel Plate. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Wear Resistant Steel Plate in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
