Abstracts

3D optical profiler is a profilometer that uses non-contact technology. They are typically built on advanced optical microscopes, providing the dual advantages of excellent imaging and no contact with the surface being measured. They use a variety of light sources (usually using high-brightness LEDs) to illuminate samples and complex cameras to capture images and then convert the images into height information using techniques such as confocal microscopy or interferometry. 3D optical profilometers can be used in a variety of applications such as automotive and precision machinery, consumer electronics, aerospace and defense, optics and photonics, as well as microfabrication and nanotechnology.
