Alkylation is the transfer of an alkyl group from one molecule to another. The alkyl group may be transferred as an alkyl carbocation, a free radical, a carbanion or a carbene (or their equivalents). An alkyl group is a piece of a molecule with the general formula C_nH_{2n+1} , where n is the integer depicting the number of carbons linked together. For example, a methyl group ($n = 1$, CH_3) is a fragment of a methane molecule (CH_4). Alkylating agents utilize selective alkylation by adding the desired aliphatic carbon chain to the previously chosen starting molecule. This is one of many known chemical syntheses. Alkyl groups can also be removed in a process known as dealkylation. Alkylating agents are often classified according to their nucleophilic or electrophilic character.

In oil refining contexts, alkylation refers to a particular alkylation of isobutane with olefins. For upgrading of petroleum, alkylation produces a premium blending stock for gasoline.

2,2,4-Trimethylpentane, also known as isooctane or iso-octane, is an organic compound with the formula $(CH_3)_3CCH_2CH(CH_3)_2$. It is one of several isomers of octane (C_8H_{18}). This particular isomer is the standard 100 point on the octane rating scale (the zero point is *n*-heptane). It is an important component of gasoline, frequently used in relatively large proportions to increase the knock resistance of the fuel.

The Alkylate and Isooctane market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
