## **Abstracts**

The term 'application container,' which has several meanings in IT, has come to be used for a new type of technology that helps provide consistency and efficient design in the context of hardware virtualization. In virtualization, an application container is a controlling element for an application instance that runs within a type of virtualization scheme called container-based virtualization. In traditional hypervisor-based virtualization, isolated processes and machines run on their own individual operating systems, independently attached to a controlling hypervisor. The virtualization system allocates memory and processing power as needed.
