Abstracts

Aviation fuel is a specialized type of petroleum-fuel used to power aircraft. It is generally of higher quality than fuels used in less critical applications, such as heating or road transportation, and often contains additives to reduce the risk of icing or explosion due to high temperature among other properties.

Most current commercial airlines and military aircraft use jet fuel for maximum fuel efficiency and lowest cost. Aviation fuel generally arrives at the airport via pipeline systems, such as the CEPS (Central Europe Pipeline System) in Europe. It is then pumped over and dispensed from a tanker. The fuel is then driven up to parked aircrafts and helicopters. Some airports have pumps similar to filling stations to which aircraft must taxi. Some airports have permanent piping to parking areas for large aircrafts. The Aviation Fuel market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
