Abstracts

Charcoal is wood that has been placed inside a low oxygen environment like a steel or clay box and heated to over 1000°F. The lack of oxygen is important because that means the wood can't actually combust, or catch fire. Instead, the other things that make up wood – the water, tar, and gases like methane, - will melt or evaporate, be leaving only pure carbon and ash. When lit, charcoal produces intense heat with very little smoke, perfect for high heat searing or low and slow grilling.

The Barbecue Charcoal market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
