Abstracts

Blind rivets are named so because they can be installed without access to the back side of the item being riveted. They are composed of the rivet and an integrated mandrel.

Blind rivets are installed in a tight hole that passes through the materials being riveted (Step 1 & 2). A riveter is used to pull the mandrel back while holding the rivet in place (Step 3). As the mandrel is pulled back it deforms the rivet pushing the sides outward until the mandrel snaps (Step 4). This expanded size forms the back side of the rivet holding the materials together.

Blind rivets allow objects to be fastened together when access is only possible from one side. Blind rivets are commonly used with electronics, structural steel beams, and aircraft.

The Blind Rivet market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
