## Abstracts

Extrusion is a process used for the creation of fixed cross-sectional profiles. Materials, such as plastic or thermoplastic, are pressed through a die of desired shape and cross-section. Plastic extrusion is a manufacturing process using which high volumes of plastic material is manufactured and produced to form a continuous profile. Plastic extrusion is used for the manufacturing of plastic products, such as weather-stripping lines, pipes, tubes, deck railings, plastic films, window frames, plastic sheets, wire insulations and thermoplastic coatings. The prominent advantage of the plastic extrusion process is that the plastic can be given any complex shape and molded into any design without the appearance of any cracks or imperfections as the plastic encounters only shear and compressive stresses. That apart, the process also helps in manufacturing parts and components with excellent surface finish. The extruder machine contains a barrel and screw, heaters, die and screw drives. The extrusion machine works on the application of two conditions pressure. Additionally, the mixing action of the plastic compound through the shearing action is facilitated by the extruder screw. The plastic extrusion process is used for the manufacturing of plastic tires and belt conveyors in the global market. Extrusion machines can be used for the manufacturing of several materials from thermoplastic plastic, thermoplastic and natural plastic. The cross-sectional shapes or profiles, such as cord, rectangles, squares and triangular shapes and hollow sections of the aforementioned profiles can be easily manufactured using plastic extrusion machines.

The Blown Film Extrusion Machinery market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
