Abstracts

The Bone Anchored Hearing Aid (BAHA) is a surgically implanted device designed to help people with hearing loss. The majority of the conventional hearing aids transmit sound through the medium of air conduction. BAHA stimulates the cochlea by transmitting the sound waves through the bones in our skull, or bone conduction, thereby bypassing the outer and middle ear. Once the cochlea receives the sound signals, the information is converted in to neural signals and transferred to the brain, where it is perceived as sound. thereby bypassing the outer and middle ear.
