Abstracts

Bridge Rectifier converts the alternating current generated by the alternator into direct current, so as to supply power to the electrical equipment and charge the battery, and restrict the battery current from flowing back to the generator to protect the generator from being burned by the reverse current. The bridge rectifier circuit overcomes the disadvantages of the full-wave rectifier circuit that requires the center tap of the transformer secondary and the diode to withstand the back pressure, but additionally uses two diodes. With the rapid development of semiconductor devices and the low cost, this disadvantage is not prominent, and thus bridge rectifier circuits are widely used in practice.

The Bridge Rectifier market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
