IDSs identify malicious activities over the network and intrusion prevention systems (IPSs) prevent data modification or unauthorized access. IDSs and IPSs include hardware, software, and services. IDS is a passive monitoring system that warns the system administrator of any suspicious activity, while IPS enables the administrator to take appropriate action upon the alert generated by the IDS. IDS is adopted and implemented by organizations to collect and analyze different types of attacks within a host system or network. It also helps to identify and detect possible threats, which include attacks from both inside and outside of an organization.
