Abstracts

A cryogenic pump functions by freezing oil, water vapor, and others gases out of the atmosphere within the vacuum chamber or system. Water and gases are frozen onto several arrays located inside the cryogenic pump. The cryogenic pump operates on the principle of closed cycle refrigeration. These pumps are commonly cooled by compressed helium, although they may also use liquid nitrogen, dry ice, or a built-in cryocooler. Some pumps have multiple stages at several low temperatures. The outer stages shield the coldest inner stages, and condense high boiling point gases such as water and oil, thus saving the surface area and refrigeration capacity of the inner stages for lower boiling point gases such as nitrogen.

The Cryogenic Pump market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
