Abstracts

D-sub Connectors contain two or more parallel rows of contacts surrounded by a characteristic D-shaped metal shell. The shell not only provides mechanical support and ensures the correct orientation, but it may also screen against electromagnetic interference (EMI). Several methods are used to connect the system circuitry to the contacts in D-sub connectors, including crimp, solder cup, PCB solder, PCB press-fit and wire wrap connections. Many times locking systems are implemented to ensure the connectors remain in a mated state despite shock and vibration conditions. D-sub Connectors work with a wide variety of electronics. They are often found on communications ports, creating connections between different products such as computers, printers, and power supply units.

The D-Sub Connectors market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
