Abstracts

Electric Motors is a device that converts electrical energy into mechanical energy. It uses a coiled coil to generate a rotating magnetic field and acts on the rotor to form a magnetoelectric rotational torque. Generators is a mechanical device that converts other forms of energy into electrical energy. It is driven by a turbine, steam turbine, diesel engine or other power machinery to convert the energy generated by water flow, gas flow, fuel combustion or nuclear fission into mechanical energy that is transmitted to the generator, which is then converted into electrical energy by the generator.
