Abstracts

Embedded security reduces the vulnerabilities and offers protection against threats in software running on embedded devices. Similar to the security in most IT fields, embedded system security includes a thorough method to hardware design and coding as well as additional security software, an adherence to best practices and consultation with experts. Earlier embedded operating systems did not have undeviating internet connection which has provided some degree of security, both through insignificance and the fact that they were not convenient targets as they have little need to be exposed. Due to the advancement of the new technologies like machine-to-machine (M2M) communication, Internet of Things and remotely-controlled industrial systems have increased the number of connected devices which made these devices as target. Embedded security helps to define a standardized reference secure and strong architecture for embedded systems. Embedded security ensures that systems continues to function at the time of cyber-attacks. Embedded security enables a system to defend against threats, withstand attacks & complete mission goals, recover from a degraded state and return to a normal state, and evolve to improve defence and resilience against further threats.

The Embedded Security market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
