Abstracts

Embolization is a minimally invasive therapy to stop bleeding as well as to stop blood flow to a tumor in order to shrink it or in preparation for removal. In this procedure, some embolized particles or substances are injected into the veins of the patients to block or reduce the blood flow to cancer cells. Embolization is an option for some patients with tumors that cannot be removed by surgery. It can be used for tumors that are too large to be treated with ablation (usually larger than 5 cm thickness). It can also be used with ablation. Embolization does reduce some of the blood supply to the normal liver tissue, so it may not be a good option for some patients whose liver has been damaged by diseases such as hepatitis or cirrhosis. Embolization is used in many procedures as a part of interventional radiology.

The Embolization Particle market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
