Abstracts

The empennage is a device that is mounted at the rear of the aircraft to enhance flight stability. Most tails include horizontal and vertical tails, and a few use V-tails. The empennage can be used to control the pitch, yaw and tilt of the aircraft to change its flight attitude. The rear wing is an important part of the flight control system.

The rear wing, professionally known as spoiler, is part of the automotive aerodynamic package. The main function of the rear wing of the car is to reduce the lift of the tail of the vehicle. If the lift of the tail is larger than the lift of the front, it will easily lead to excessive steering of the vehicle, reduced grip of the rear wheel and poor high-speed stability.

The Empennages market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
