Abstracts

Fault-tolerant technology involves the capability of a computer system, electronic system to deliver uninterrupted services, despite failing of one or more of its components. It is basically the ability of a system to respond gracefully at the time of an unexpected hardware or software failure. Fault tolerance resolves potential service interruptions in case of logic errors as well. The main purpose for these server and technology is prevention of catastrophic failure that may result from a single point of failure hampering access to the complete data putting at risk the unsaved data by user. During virtualization of critical applications, it is important for understanding the protection related to server assets as problems in a single virtualized platform means failure of everything in case of platform failure which is the reason for the application of fault tolerant servers. The fault-tolerant platforms helps in avoiding this complexity further delivering simplicity and reliability especially in virtualized implementations.

The Fault-tolerant Server market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
