Caking or clumping is a significant concern in dry fertilizer production, storage, transport and application. Crystallization of water soluble salts and the resulting bridges between the surfaces of fertilizer particles is a common mechanism that causes caking. Pressure from storage conditions can also cause the surface of fertilizer particles to experience plastic deformation, causing their new contact surfaces to experience adhesion from reduced water vapor pressure.

The Fertilizer Anti-Caking Agents market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
