Abstracts

Gene expression profiling is a method of molecular gene expression in the field of molecular biology by means of cDNA, expressed sequence tag (EST) or oligonucleotide microarray (including specific gene expression, expression abundance, different tissues, different developmental stages). And methods of expression differences under different physiological conditions. By measuring a large number of genes at a time to construct an overall picture of cell function, cells that are dividing and the response of cells to characteristic treatment can be distinguished from the map. Gene expression profiling also helps to understand the pathogenesis of the disease, the physiological response of the drug, and the therapeutic effect.
