Abstracts

As a major herbicide, glyphosate is applied to the leaves of plants to kill both broadleaf plants and grasses. These are used in crops as well as non-crop plants like turfs and ornamentals. It controls weed growth by interfering with the enzymatic production of certain amino acids that are essential for the growth of a broad spectrum of weeds and their entire root system. Urea is an organic compound chemically produced from the waste that the body creates after metabolizing protein. The synthetic version of this chemical compound can be created in the laboratory in the forms of liquid and/or solid, which is often used in fertilizers as a convenient source of nitrogen. Phosphorus is one of the most common elements in our environment and is essential to human, animal and plant life. Phosphorus is present naturally in food, water and even human bodies. In your body, phosphorus is present in your genes, teeth, and bones — even your muscles work because of the phosphorus in adenosine triphosphate.

The Glyphosate market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
