By creating a spectrum similar to sunlight, growing light acts as a substitute for sunlight, helping plants during photosynthesis. Briefly, any source that is capable of stimulating plant growth by emitting electromagnetic radiation that contributes to photosynthesis can be referred to as growing light. Several geographical areas during the year have been deprived of sunlight for a long time. The lack of sunlight in these areas affects the growth of plants and degrades the flora of the area. Plants important to important industries and important species of flowering plants are exposed to light to enhance their growth.
