Abstracts

High molecular weight polyisobutene is a solid rubberlike substance; it retains its resilient and high elastic properties and belongs to 'the elastomers' in contrast to such polyolefines as polyethylene, polypropylene, polybutene, which belong to 'thermoelastoplasts'.

High molecular weight polyisobutene is a product of the method of low temperature polymerization with evaporating liquid ethylene and in presence of catalyst boron trifluoride and together with the process regulators.

Polyisobutene is a saturated carbon-chain polymer. As such it is highly resistant to oxygen, ozone, and solutions of acids, alkalis and salts. The polymer doesn't swell or dissolve in oxygen containing polar solvents, but readily dissolved in aliphatic or aromatic hydrocarbons (passing through a swelling stage).

The High Molecular Weight Polyisobutylene market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
