Noise is different from other environmental pollution. The elastic wave emitted by the sound source in the air is localized. It does not accumulate in the environment, does not last, and is not transmitted over long distances. After stopping the sound, the noise disappears immediately. Only when the sound source, the way of sound transmission and the listener are both present, the interference is formed to the listener. Therefore, the noise must be controlled from the sound source (vibrating object), the route of transmission and the recipient. In these three aspects, we must consider the three parts separately, and we must consider these three parts as a whole. The noise control system must meet the requirements of noise reduction and be reasonable in conformity with technical and economic indicators.
