Abstracts

Infantile spasms therapeutics are used for the treatment of seizures or an epilepsy syndrome in young children, usually aged one year or below. Infantile spasm refers to sudden stiffening of the body, the arms, and the legs or forward bending of the head. Primary treatments for infantile spasms include steroid therapy and an anti-seizure medicine called Sabril. Infantile spasms are also known as the West syndrome, as the disease was first defined by Dr. William James West in the 1840s. These spasms generally begin in the first year of life, between three and eight months of age, and occur in two to three out of every 10,000 babies. The disorder is more common in boys than girls. Family history is another cause— about 3% to 6% of cases can be linked to family history. The diagnosis of infantile spasms is carried out by physical and neurological examination, laboratory tests such as MRI of the brain, and blood and urine tests. Medication includes monotherapy as well as combination therapy. In approximately 20%–50% of the patients, infantile spasms evolve into the Lennox-Gastaut syndrome. Conversely, a similar percentage of patients with the Lennox-Gastaut syndrome have a history of infantile spasms
