Abstracts

Ironless linear motors are so named because the primary part (analogous to the stator of a rotary motor) is made of windings wrapped around laminated steel and embedded in epoxy resin. This construction method eliminates iron from the primary part, so unlike iron core motors, there are no attractive forces between the primary and secondary parts that can cause cogging and make assembly difficult. The absence of cogging, or detent forces, enables them to travel with virtually zero force and velocity ripple, meaning that they can travel not only at very high speeds with excellent positioning accuracy, they can also travel at very slow speeds with typically less than 0.01 percent speed variation.

The Ironless Linear Motors market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
